Restock and Replineshment

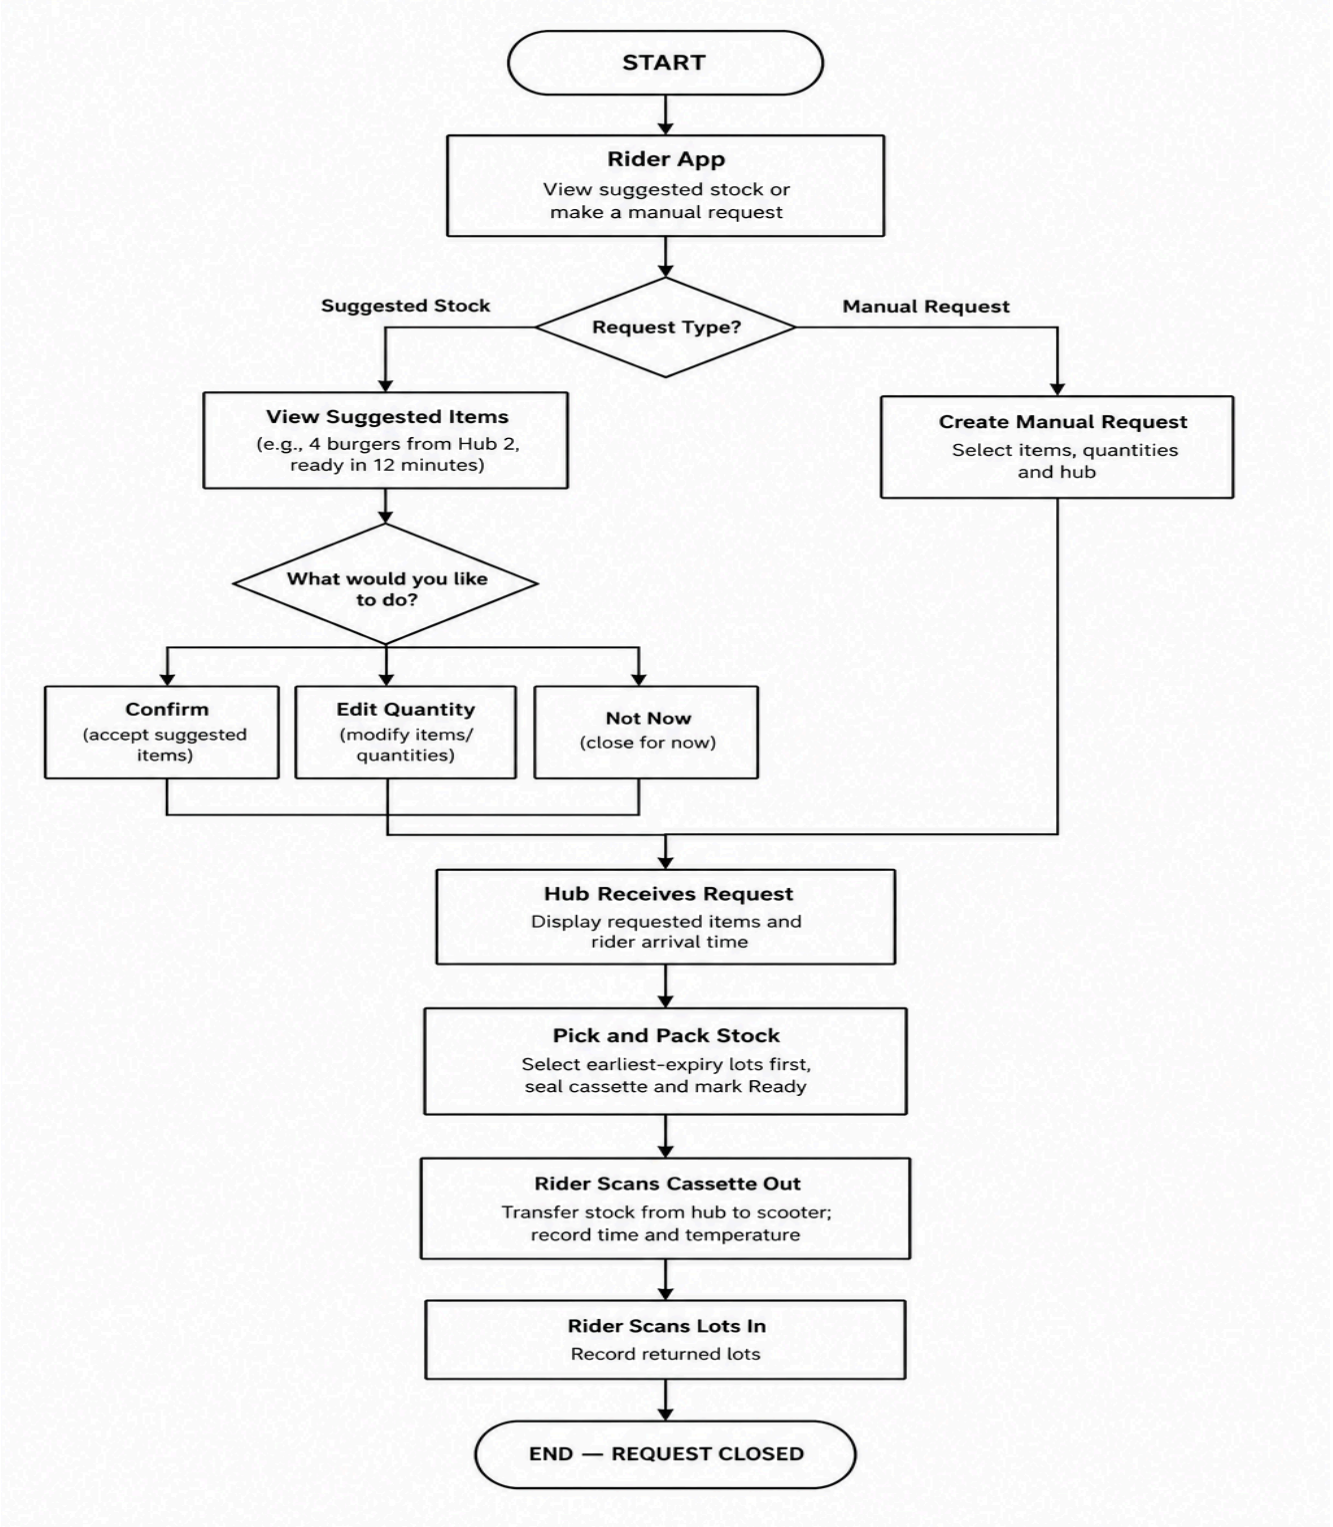

Restock and replenishment

Scooters ask hubs for stock on their own: the system drafts the request, the rider confirms or edits it, and the hub is notified. The rider stays in charge because the rider knows things the system cannot, such as a spoiled unit or a damaged box.

When projected stock reaches the reorder point, the system drafts a request. It also checks that the lots it would pick have enough shelf life left to be sold before they expire. **Refer the image above**

Request states: Suggested, Confirmed, Hub accepted, Packing, Ready, Picked up, Received, Closed. Other endings: Expired, Cancelled, Partial.

Rules that keep coverage intact :

Rule	Why
Restocks are staggered; only a set number of scooters per zone may be away	Otherwise every scooter hits its reorder point together and leaves a dead zone
A scooter on a restock trip is not offered orders	It has no stock or no time
A scooter with no stock leaves search automatically	No false promises
Hubs give queue slots	Riders do not pile up at the hub
Restock time is paid time	Riders have no reason to skip it
Duplicate requests for one scooter are merged	One scooter, one open request
A short hub fills part, offers a substitute or points to another hub, and the shortfall goes to the kitchen's plan	The kitchen learns what to make

The same logic runs one level up: each hub keeps a par level and drafts a request to the central kitchen, which the hub manager confirms. Once the pilot shows the suggestions are reliable, ops can switch on auto-submit for chosen scooters and items.
