(RAW - Problem - as of now in the current era of quick commerce we are getting the daily essentials,products in quicker manner but sometimes the ice melts , the food is not hot enough , urgency might be for pharma/tablets , need breakfast for corporates , came to different city don't know where and what to get in earliest possible way in the condition that it is served in the shops ,

Solution - earliest solution possible for the items and it's conditions served as original in these

1.snacks in hot under 90 seconds

2.craving of bevarages/cold/hot drinks which are legal to sell in commercial in 90 seconds

3.ease of getting early,original condition as served in offline .

4.daily essentials easily available .)

Structured and organized :

Problem Statement: The Quality and Latency Gap in Quick Commerce

While the current quick commerce (Q-commerce) ecosystem has drastically accelerated the procurement of daily essentials, it fundamentally struggles with product degradation and hyper-urgent fulfillment. The existing logistics infrastructure creates several critical friction points:

- **Thermal & Quality Degradation:** Transit times compromise temperature-sensitive items, resulting in melted frozen goods and heat loss in prepared foods. The end product fails to match the original, shop-served condition.
- **Unmet Hyper-Urgency:** Current delivery SLAs are insufficient for critical, immediate-need items such as pharmaceuticals or highly time-sensitive corporate breakfast schedules.
- **Geographic Friction:** Transient consumers (e.g., travelers, out-of-town professionals) face high search costs and unpredictable wait times when attempting to procure reliable essentials in unfamiliar cities.

Proposed Solution: Ultra-Fast, Condition-Preserved Fulfillment Infrastructure

To resolve the inherent limitations of standard last-mile delivery, we propose a localized, rapid-fulfillment model designed to provide hyper-accessible goods with a strict 90-second turnaround. This infrastructure guarantees that items are dispensed and consumed exactly as they would be in a premium offline retail environment.

Core Capabilities & Offerings:

- **Instant Hot Culinary Fulfillment:** Dispensing hot snacks and prepared foods in under 90 seconds, utilizing advanced thermal retention to maintain optimal serving temperatures.
- **Rapid Beverage Dispensing:** Delivering commercially compliant hot and cold beverages within the same 90-second threshold, preserving exact intended temperature states.
- **Retail-Parity Experience:** Eliminating the transit-degradation variable to ensure users receive products in their pristine, original condition without logistical wear.

- **Frictionless Daily Essentials:** Creating an immediate-access ecosystem for high-frequency daily goods and urgent necessities, effectively bridging the gap between digital convenience and physical retail quality.

Product Info in brief :

The goal is to keep sealed, temperature-tracked food inside scooters that wait near demand, so that once the system accepts an order, a scooter reaches the customer's chosen gate within 90 seconds, safely. We prove it first in one micro-market with 4-8 scooters and 1-3 menu items.

Words used in these docs

Term	Plain meaning
Gate	The exact entry point the customer picks for delivery
Gate pin	The gate's map location plus entry instructions
Sweet spot	The area a scooter can start from and still reach a gate within the time budget
Staging node	A legal place where a scooter waits for orders
Lot	One labelled batch of food with its prepared and expiry times
Reservation	A short hold on units so nobody else can buy them
Acceptance	The moment the server confirms the order and starts the 90 s clock
Leg	One scooter's share of an order
Hub	A small site where scooters restock
Kill switch	A control that turns the 90 s offer off for a zone
p90	The time that 9 out of 10 trips beat
